

CHAPTER II – Decision making

1-Break-even analysis

- *Evaluating services or products*
 - *Volume sufficient to break even*
 - *The portion of the total cost that varies directly*
 - *The variable cost per unit*

Example

FINDING THE BREAK-EVEN QUANTITY

A hospital is considering a new procedure to be offered at \$200 per patient. The fixed cost per year would be \$100,000, with total variable costs of \$100 per patient. What is the break-even quantity for this service? Use both algebraic and graphic approaches to get the answer.

Break-Even Analysis

Break-Even Analysis

Example A.1

Break-Even Analysis

Quantity (patients) (Q)	Total Annual Cost (\$) (100,000 + 100Q)	Total Annual Revenue (\$) (200Q)
0	100,000	0
2000	300,000	400,000

Example A.1

Break-Even Analysis

Quantity (patients) (Q)	Total Annual Cost (\$) (100,000 + 100Q)	Total Annual Revenue (\$) (200Q)
0	100,000	0
2000	300,000	400,000

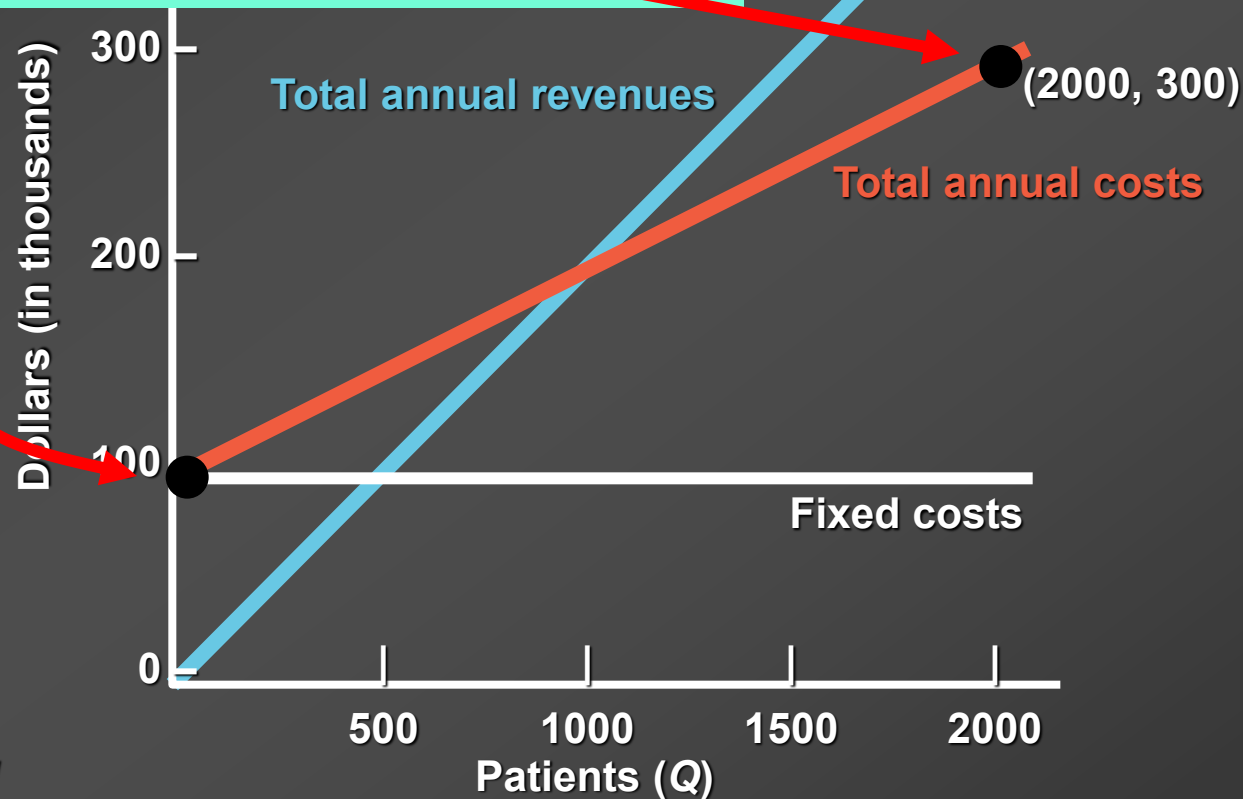

Example A.1

Break-Even Analysis

Quantity (patients) (Q)	Total Annual Cost (\$) (100,000 + 100Q)	Total Annual Revenue (\$) (200Q)
0	100,000	0
2000	300,000	400,000

Example A.1

Break-Even Analysis

Quantity (patients) (Q)	Total Annual Cost (\$) (100,000 + 100Q)	Total Annual Revenue (\$) (200Q)
0	100,000	0
2000	300,000	400,000

Example A.1

Break-Even Analysis

Figure A.1

Sensitivity analysis of sales forecasts

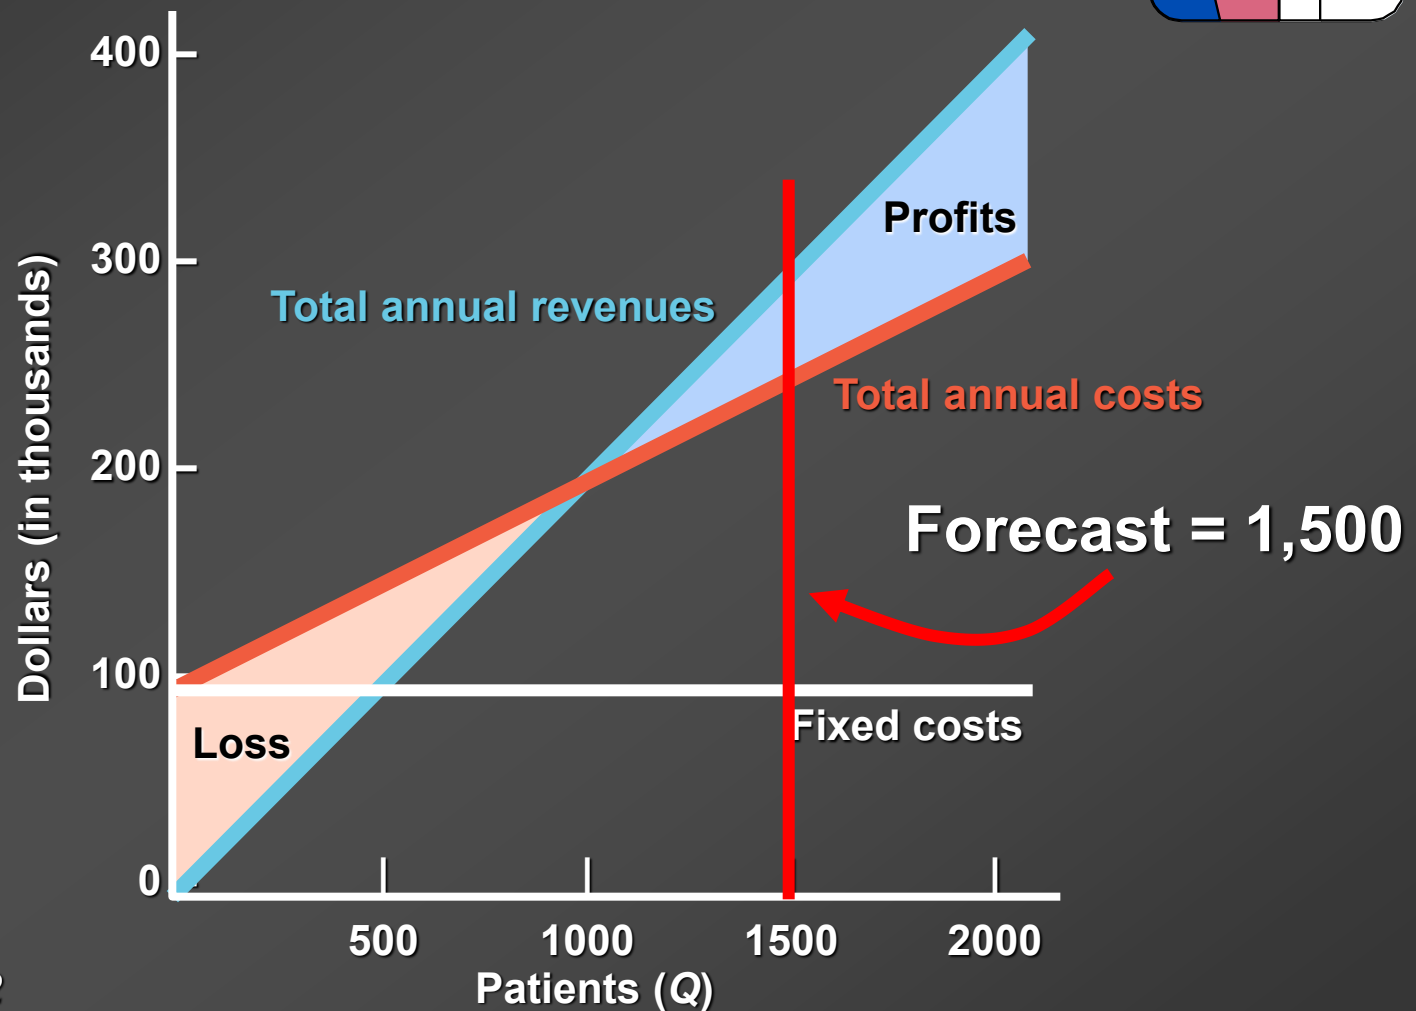

If the most pessimistic sales forecast for the proposed service in Figure A.I were 1,500 patients, what would be the procedure's total contribution to profit and overhead per year?

Sensitivity Analysis

Example A.2

Sensitivity Analysis

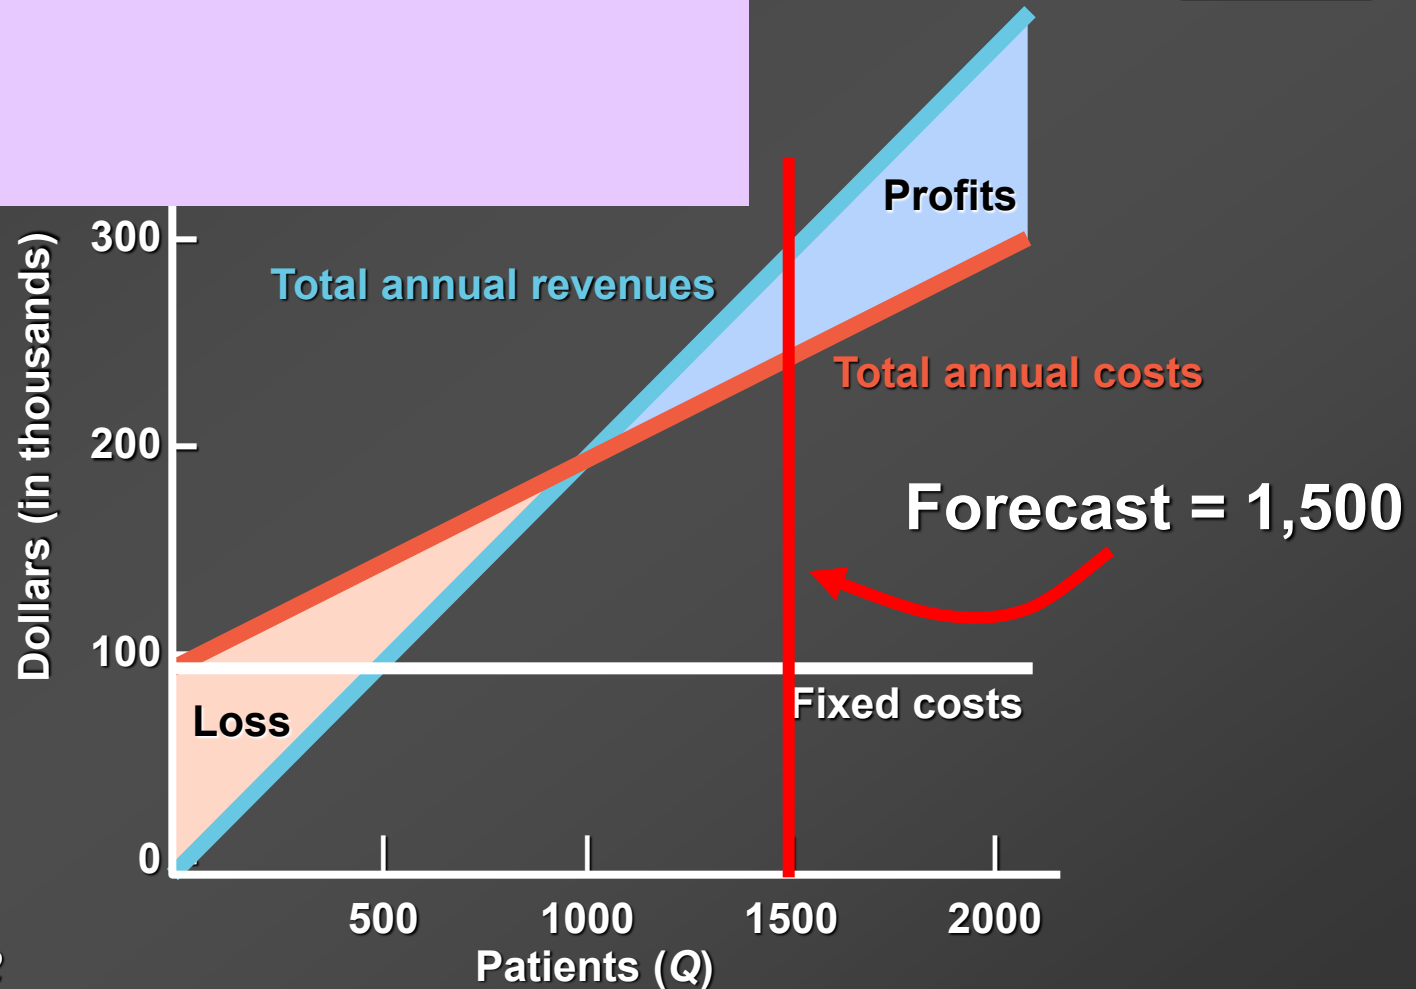

Example A.2

Sensitivity Analysis

$$pQ - (F + cQ)$$

Example A.2

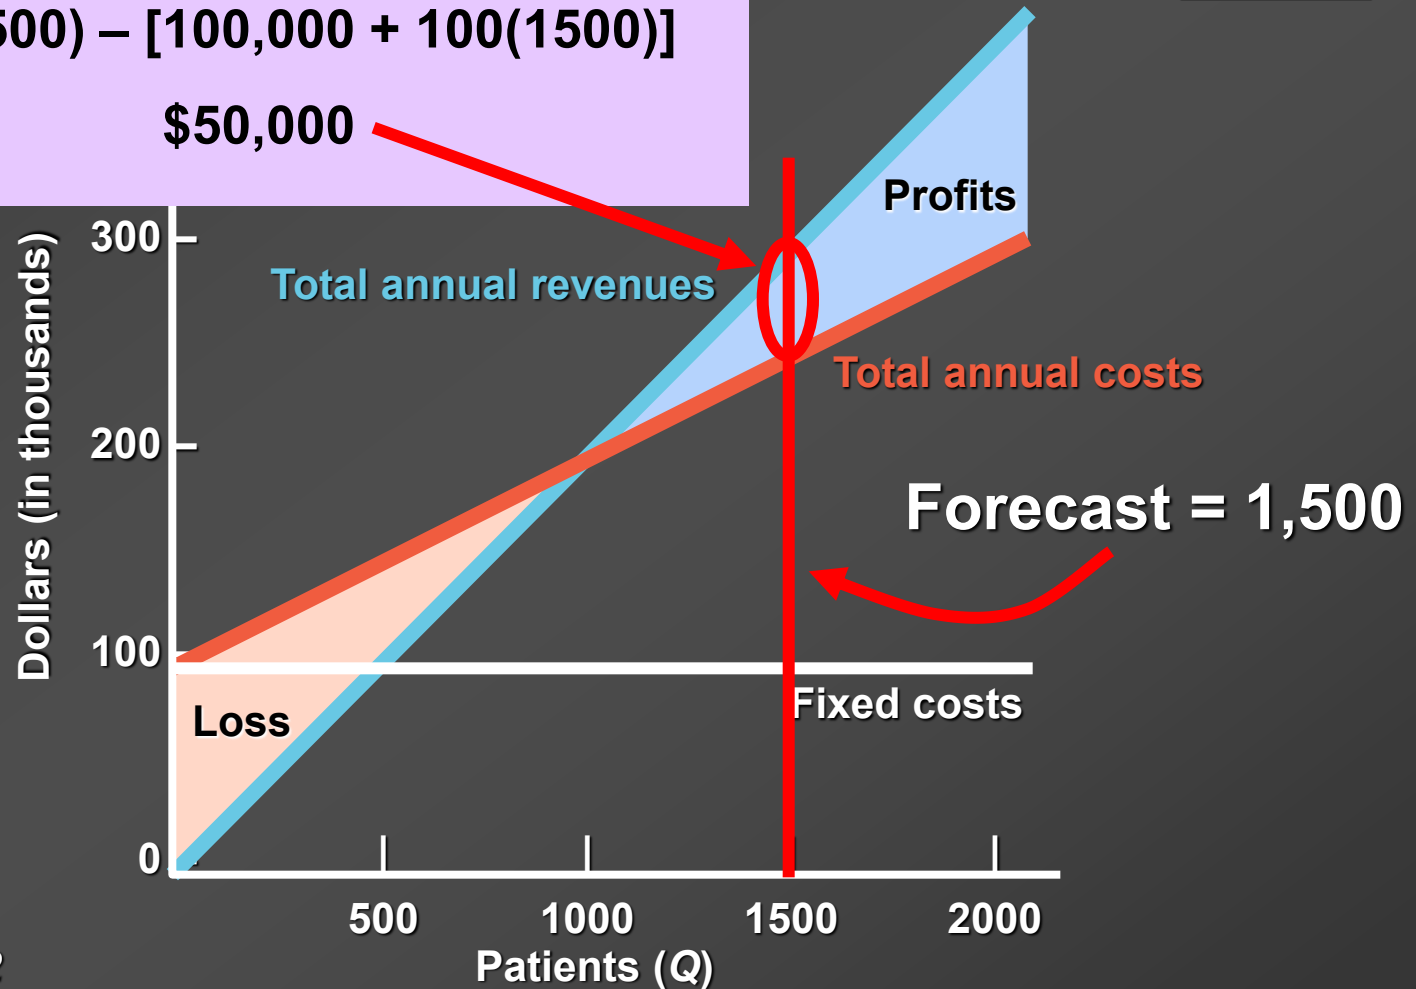

Sensitivity Analysis

$$pQ - (F + cQ)$$

$$200(1500) - [100,000 + 100(1500)]$$

\$50,000

Example A.2

Make-or-Buy Decisions

Evaluating processes

The manager of a fast-food restaurant featuring hamburgers is adding salads to the menu.

There are two options, and the price to the customer will be the same for each. The make option is to install a salad bar stocked with vegetables, fruits, and toppings and let the customer assemble the salad. The salad bar would have to be leased and a part-time employee hired. The manager estimates the fixed costs at \$12,000 and variable costs totaling \$1.50 per salad. The buy option is to have preassembled salads available for sale. They would be purchased from a local supplier at \$2.00 per salad. Offering preassembled salads would require installation and operation of additional refrigeration, with an annual fixed cost of \$2,400. The manager expects to sell 25,000 salads per year.

What is the break-even quantity?

Make-or-Buy Decisions

Investment requirements	10	2	20
Project risk	5	4	20
			<u>750</u>

Weighted score = 750

Example A.4

Together

Together

Supplier Selection

Your company is considering new suppliers in three different countries to provide critical raw materials. Each supplier has its strengths and weaknesses in terms of cost, reliability, and geopolitical stability.

Questions:

- What decision-making framework will you use to evaluate these suppliers?*
- How will you assess the risks associated with each supplier?*
- How will you ensure a balanced and diversified supply chain?*

3- decision theory

- *List the feasible alternatives*
- *List the events*
- *Calculate the payoff*
- *Estimate the likelihood of each events*
- *Select a decision rule*

NETWORK DESIGN DECISIONS

- *Introducing method*
 - *Fixed and variable cost*
 - *Identified forecasts*
 - *One product*
 - *Total cost is fixed cost + unit variable cost x Quantity*
 - *Example and identification of equivalence levels*
 - *Best choice is*

Fixed and variable cost

Site	Fixed cost	Variable cost
A	250 000 \$	11 \$ per unit
B	100 000 \$	30 \$ per unit
C	150 000 \$	20 \$ per unit
D	200 000 \$	35 \$ per unit

Site	Fixed cost	Variable cost ...	Total cost
A	250 000 \$	11x10 000 u	360 000 \$
B	100 000 \$	30x 10 000 u	400 000 \$
C	150 000 \$	20 x 10 000 u	350 000 \$
D	200 000 \$	35 x 10 000 u	550 000 \$

Let's come back to break even

$$100\,000 \$ + 30 \$ \times Q = 150\,000 \$ + 20 \$ \times Q \quad Q = 5000 \text{ u}$$

$$150\,000 \$ + 20 \$ \times Q = 250\,000 \$ + 11 \$ \times Q \quad Q = 11\,111 \text{ u}$$

$$100\,000 \$ + 30 \$ \times Q = 250\,000 \$ + 11 \$ \times Q \quad Q = 7\,895 \text{ u}$$

NETWORK DESIGN DECISIONS

- ***Transport cost***
 - *Impact*
 - *Finished goods flows*
 - *Raw materials*
 - *Multi choice to be solved through transport model*
- ***Weighing method***
 - *Relevant factors*
 - *Weighing*
- ***Gravity center method***
 - *Geographical coordinates*

Gravity center method

Coordinates of x, y

Average of $x = \text{Sum of } x_i / n \text{ destinations}$

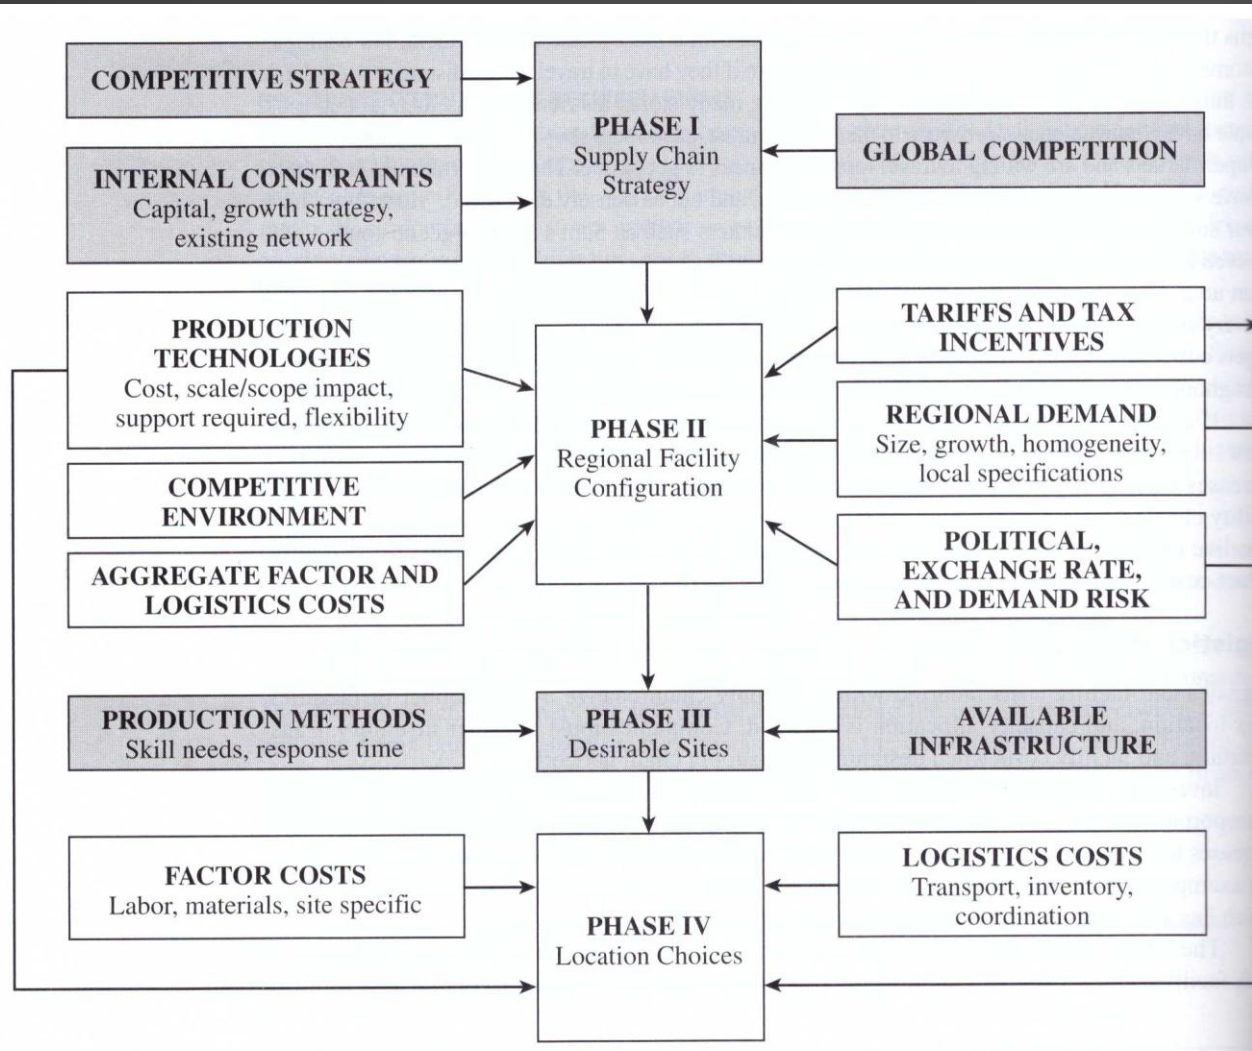

Average of $y = \text{sum of } y_i / n \text{ destinations}$

Average of x, y will be optimum location

BUT
we have to take into account
quantities carried

- *Average of x becomes*
 $\text{sum of } x_i \cdot Q_i / \text{sum } Q_i$
- *Average of y becomes*
 $\text{sum of } y_i \cdot Q_i / \text{sum } Q_i$

NETWORK DESIGN DECISIONS

Together

Route Optimization

Your company needs to transport goods from a manufacturing plant in Vietnam to distribution centers in Europe. Due to rising fuel prices and environmental regulations, optimizing transportation routes is crucial.

Questions:

- *Which criteria will you prioritize in your route optimization (cost, time, environmental impact)?*
- *What alternative transportation methods could you consider (e.g., sea, air, rail)?*
- *How will you balance the trade-offs between cost, speed, and sustainability?*

J	1	2	15	4	5.44
K	5	6	7	6	0.11

St. Adolf's Hospital

Probabilities

Critical Path = B - D - H - J - K

$T = 72$ days

$T_E = 69$ days

$$\sigma^2 = \Sigma (\text{variances of activities}) \quad z = \frac{T - T_E}{\sqrt{\sigma^2}}$$

$$\sigma^2 = 1.78 + 1.78 + 2.78 + 5.44 + 0.11 = 11.89$$

$$z = \frac{72 - 69}{\sqrt{11.89}}$$

APPENDIX 2

[illegible]

St. Adolf's Hospital

Probabilities

Critical Path = B - D - H - J - K

$T = 72$ days

$T_E = 69$ days

$$\sigma^2 = \sum (\text{variances of activities}) \quad z = \frac{T - T_E}{\sqrt{\sigma^2}}$$

$$\sigma^2 = 1.78 + 1.78 + 2.78 + 5.44 + 0.11 = 11.89$$

$$z = \frac{72 - 69}{\sqrt{11.89}} = 0.87$$

From Appendix 2

$$P_z = .8078 \approx .81$$

Design network decisions

- ***Complete method***
 - ***Location of supply sources and markets***
 - ***Location of potential facility sites***
 - ***Demand forecast by market***
 - ***Facility, labor and material costs by site***
 - ***Transportation costs between each pair of sites***
 - ***Inventory costs by site and as a function of quantity***
 - ***Sale price of product in different regions***
 - ***Taxes and tariffs***
 - ***Desired response time and other service factors***

Cost & Demand Data related to U.S. Petroleum

<u>Inputs-Costs,Capacities, Demands</u>									
<u>Demand Region :</u>	Production and transportation cost per 1,000,000 units					Fixed	Low	Fixed	High
<u>Supply region</u>	N America	S America	Europe	Asia	Africa	cost \$	capacity	cost \$	capacity
N.America	81	92	101	130	115	6000	10	9000	20
S. America	117	77	108	98	100	4500	10	6750	20
Europe	102	105	95	119	111	6500	10	9750	20
Asia	115	125	90	59	74	4100	10	6150	20

<i>Demand</i>	12	8	14	16	7				

with

U.S. Petroleum

n = number of potential plant locations/capacity (each level of capacity will count as a separate location)

m = number of markets or demand points

D_j = annual demand from market j

K_i = potential capacity of plant i

f_i = annualized fixed cost of keeping factory i open

c_{ij} = cost of producing and shipping one unit from factory i to market j (cost includes production, inventory, transportation and tariffs)

y_i = 1 if plant is open, 0 otherwise

x_{ij} = quantity shipped from plant i to market j

U.S. Petroleum

$$\text{Min } \sum_{i=1}^n f_i y_i + \sum_{i=1}^n \sum_{j=1}^m c_{ij} x_{ij}$$

Under conditions to minimize the total cost

$$\sum_{i=1}^n x_{ij} = D_j \text{ for } j = 1, \dots, m$$

Demand at each regional market is satisfied

$$\sum_{j=1}^m x_{ij} \leq K_i y_i \text{ for } i = 1, \dots, n$$

No plant can supply more than its capacity (0 or 1)

$$y_i \in \{0, 1\} \text{ for } i = 1, \dots, n, x_{ij} \geq 0$$

so each plant is either open ($y_i = 1$) or closed ($y_i = 0$)

The solution identifies the plants that are to be kept open, their capacity, and the regional allocation of the demand for these plants.
